

## **OPERATING INSTRUCTIONS**

Congratulations on your QuietCool whole house fan system!

Timer Functions:

- Ability to set for hourly durations of: 1-hr, 2-hr, 4-hr or 8-hr
- Hold button keeps whole house fan on until turned off manually

How to best maintain a cool home:

- Run the QC fans for an hour in the morning, this will flush out the house & attic air
- Keep upstairs closed, open a few windows 4-6" downstairs
- Before heat of the day comes, close up house, utilize ceiling fans & close curtains
- Climate maintenance gets house ready for the day, will start day off up to 20 degrees cooler

During the heat peak of the day you may use the A/C. Your A/C will work quicker while usage is drastically reduced throughout morning, evening & night by utilizing the QuietCool system properly, following these steps.

Evening:

- Your home may be stuffy from being closed up all day
- Initiate "Zone Cooling" in late afternoon, as weather cools
  - > Crack windows downstairs in kitchen/living rooms & most used rooms (keep upstairs closed, initially)
- As evening progresses, crack open windows in bedrooms that you want to cool
- When going to bed, close windows downstairs so additional airflow can be felt through bedrooms
- Recommend placing system on 4-hour timer; or HOLD for hotter nights, if desired
- Less windows open = More powerful airflow

The system requires zero maintenance; however grilles do collect dust, recommend cleaning every 6-8 weeks during summer months.

Damper system: when system is off, the damper seals so there is no heat loss or gain from attic.
